Disinfection of Field Equipment to Minimize Risk of Spread of Chytridiomycosis and Ranavirus

Importance of Disinfection
The spread of pathogens is a major threat to amphibians and reptiles worldwide. This is particularly true for Ranavirus (RV) and Batrachochytrium dendrobatidis (Bd) responsible for chytridiomycosis. Humans can transmit diseases from one place to another and from one organism to another in a short amount of time and over distances the organisms cannot traverse. With the increasing spread of pathogens and reports of die-offs among amphibians and select reptiles worldwide, it is imperative that field biologists, researchers, hobbyists, and anyone interested in recreational herpetology-related field activities employ basic disinfecting procedures to prevent the spread of pathogens.

Before Leaving for the Field
Although other chemicals are effective (see table), NEPARC recommends a 3% bleach solution to inactivate Bd and most RV’s. Concentrated bleach is inexpensive and readily available. However, diluted bleach solutions lose their potency if exposed to air, sunlight, or organic material, and should be discarded after 5 days if exposed. To ensure maximum efficacy, prepare only as much solution as you will need for the sampling event.

Suggested equipment:
- Brushes for scrubbing and/or removing mud and vegetation from equipment.
- Hand sanitizers and antiseptic alcohol wipes.
- Handheld bottles and/or pump sprayers for applying bleach and water. Bring clean rinse water.
- Gloves for handling animals. These should be disinfected or discarded between animals.
- Plastic bags of different sizes: examining animals in bag minimizes contact.
- Prepare additional sets of equipment if sampling at multiple locations.
- Trash bags.

Instructions for Large Equipment
Brush off mud, wash with biodegradable soap, disinfect with bleach and rinse all exterior surfaces of boats, canoes, vehicles or trailers and their tires that may have come in contact with potentially affected water (e.g. stream or wetland).

After Each Sampling Event and Before Moving to the Next Site
1. Brush off mud and vegetation from field equipment (e.g., nets, buckets, boots). Soil or mud can reduce the effectiveness of the disinfection process.
2. Generously spray or immerse all items in bleach solution.
   - Bleach is highly toxic to aquatic organisms; stand at least 50 m from any natural water source.
   - Lab studies indicate 1 minute contact time to be sufficient to inactivate pathogens but NEPARC recommends 5 minutes in field situations.
3. Rinse bleached items with water to minimize damage to the equipment and to prevent exposing the next wetland to residual bleach.
4. Use alcohol wipes to disinfect calipers, measuring boards, and other sensitive equipment.

End of the Day
After returning from the field, all equipment should be washed and thoroughly disinfected. If available, set up 2 buckets or large tubs: one with soapy water and one with 3% bleach solution.

Brush or scrub off any soil or vegetation. Immerse into soap, wash then rinse.
- Immerse in bleach and leave for 5 minutes. Rinse thoroughly with water.
- Hang equipment and gear, and allow them to air dry completely.
## Disinfection Options for Ranavirus (RV) and *Batrachochytrium dendrobatidis* (Bd)

Although these chemicals were not developed specifically for RV or Bd, these recommendations represent the minimum concentration and contact time demonstrated as effective.

### Special Instructions:

- • Remove debris from equipment prior to treatment. • Wear safety glasses and gloves when handling chemicals. • Water pH can affect chemicals; all information in this table assumes the use of tap or municipal water. • Keep out of lakes, streams, or ponds; stand at least 50 m from any natural water source. • Do not clean equipment or dispose of waste solutions at field sites. • For disposal, follow local, state, and federal guidelines.

**Bleach:** Inactivated by organic material. • Inactivated by sunlight. • If in an opaque container, diluted bleach will last 1 month. If exposed to sunlight or air, it will only last 5 days.

**Nolvasan:** Can be inactivated by organic material. • Store at room temperature in sealed container. • Dilute concentrate with water of pH 5-7. • Remains stable for 1 week if dilute with tap water, and for up to 6 weeks if diluted with deionized water. • Use concentrate within 36 months. • Toxic to fish.

**Virkon-S:** Store at room temperature. • Keep solution away from extreme cold or heat. • Shelf life for tablets is 2 years and for powder is 3 years. • Remains stable for 1 week if diluted with tap water.

**Ethanol:** Highly flammable. • Use and store in a well ventilated area. • Evaporation may diminish effective concentration.
