Global Rank Codes: GX = Presumed Extinct, GH = Possibly Extinct, G1 = Critically Imperiled, G2 = Imperiled, G3 = Vulnerable, G4 = Apparently Secure, G5 = Secure, GU = Unrankable (due to lack of information), G? = Unranked, HYB = interspecific hybrid. Rank qualifiers: ? = Inexact numeric rank, Q = Questionable Taxonomy, C = Captive or Cultivated Only.

T = Intraspecific Taxon (trinomial): The status of intraspecific taxa (subspecies or varieties) are indicated by a "T-rank" following the species' global rank. For example, the global rank of a critically imperiled subspecies of an otherwise widespread and common species would be G5T1. A T subrank cannot imply the subspecies or variety is more abundant than the species= basic rank (e.g., a G1T2 subrank should not occur). A population (e.g., listed under the U.S. Endangered Species Act or assigned candidate status) may be tracked as an intraspecific taxon and given a T rank; in such cases a Q is used after the T rank to denote the taxon's questionable taxonomic status
